

# 4-Station Network Tap Implementation Detail

1 The passive 4-Station Tap creates multiple permanent, in-line access ports to monitor all full-duplex traffic without data stream interference. The benefits of four “zero delay” network taps are incorporated in a streamlined 1U high design.

Each monitoring device sees the same traffic as if it were also in-line, including physical layer errors.

## 4-Station Ethernet Tap

2 The signals for each of the four network links are regenerated, so that each of the four monitoring devices has access to all traffic on their respective link.
